## Sales datamart: transformed tables

| Table | Field | Type / key |
|---|---|---|
| customers_Dataflow | customer_id | STRING, primary key |
| | name, region | STRING |
| products_Dataflow | product_id | STRING, primary key |
| | name, category | STRING |
| | price_cents | INT64, cents |
| orders_Dataflow | order_id | STRING, primary key |
| | customer_id | STRING, foreign key to customers |
| | product_id | STRING, foreign key to products |
| | order_date | DATE |
| | quantity | INT64 |

Each customer can place many orders; each product can appear in many orders. Each order references exactly one customer and one product. Foreign-key checks identify unresolved references before reports are interpreted.
